IV Nutrient Infusions Weight Loss / Metabolism Infusion

If at first you don't succeed...Try again!!! Weight loss is a journey...marathons take training!

Zinc: After iron, zinc is the second most abundant trace element in the human body. Zinc also plays a role in the regulation of the immune system. Being an essential element, it is not synthesized by the human body but must be ingested through food or mineral supplements. Some of the common food sources of zinc include beef, poultry, seafood, and grains, among others.

Zinc deficiency can result in a variety of illnesses and medical disorders. Some of the clinical manifestations include, but are not limited to, the following:

- Hair and weight loss.
 - Delayed wound healing and skin lesions such as oral lichen planus, pemphigus vulgaris, among others.
 - Decreased taste sensation and loss of appetite.
 - Increased susceptibility to infections
 - Exacerbation of hypertension as well as other cardiovascular diseases.
 - Delayed puberty and growth retardation in adolescents.
 - Osteoporosis as well as other abnormalities in bone mineralization
 - Decreased folate absorption which may result in macrocytic megaloblastic anemia.
- Mental lethargy and mood disorders.

B Complex Vitamins: Vitamin B complex is essential for a wide variety of functions in the human body, its deficiency can also lead to several disorders including chronic neurological ones. B complex deficiency is normally caused due to four possible reasons; high consumption of processed and refined food, with lack of dairy and meat-based food in diet, excessive consumption of alcohol, impaired absorption from the gastrointestinal tract or impaired storage and use by liver.

Lipo-C

Lipo-C injection contains a mixture of compounds that may aid in the reduction of adipose tissue (fat). The mixture of compounds individually may be effective, however in combination they may exhibit more lipotropic activity than when administered alone in a synergistic fashion.

Methionine, which helps the liver maintain the optimal ability to process fatty acids; Choline, which stimulates the mobilization of fatty acids and prevents their deposition in a given part of the body; and, Inositol, which aids in the transport of fat into and out of the liver and intestinal cells, acts synergistically with choline, exhibiting more lipotropic activity than when administered alone.

Glutathione

Glutathione (GSH) is composed of three amino acids combined to produce a *peptide* that is both a powerful antioxidant and performs several critical roles in the body. According to researchers this peptide is so essential to optimum health that the level of Glutathione in cells could possibly be used to predict how long an organism lives. Aids in: immune functions, detoxification, chronic disease, atherosclerosis.

Magnesium: Magnesium is essential to practically all body systems. With 60% of magnesium within the body found in the bones and 27% in the skeletal muscle, magnesium plays an essential role in maintaining the integrity of the musculoskeletal system. Magnesium promotes bone mineralization through the activation of vitamin D.

Alpha Lipoic Acid:

Alpha lipoic acid (ALA, thioctic acid) is an endogenous, potent antioxidant that is purported to be useful in the treatment of diabetes mellitus, diabetic neuropathy, dementia secondary to Alzheimer's disease or human immunodeficiency virus (HIV) infection, glaucoma, amanita mushroom poisoning, and alcoholic liver disease.
